Python For Data Science Cheat Sheet **NumPv Basics**

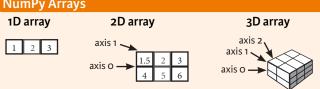

NumPy

The **NumPy** library is the core library for scientific computing in Python. It provides a high-performance multidimensional array object, and tools for working with these arrays.

Use the following import convention: >>> import numpy as np

NumPy Arrays

Creating Arrays

```
>>> a = np.array([1,2,3])
>>> b = np.array([(1.5,2,3), (4,5,6)], dtype = float)
>>> c = np.array([[(1.5,2,3), (4,5,6)], [(3,2,1), (4,5,6)]],
                 dtype = float)
```

Initial Placeholders

>>> np.zeros((3,4))	Create an array of zeros
>>> np.ones((2,3,4),dtype=np.int16)	
>>> d = np.arange(10,25,5)	Create an array of evenly
	spaced values (step value)
>>> np.linspace(0,2,9)	Create an array of evenly
	spaced values (number of samples)
>>> e = np.full((2,2),7)	Create a constant array
>>> f = np.eye(2)	Create a 2X2 identity matrix
>>> np.random.random((2,2))	Create an array with random values
>>> np.empty((3,2))	Create an empty array

Saving & Loading On Disk

```
>>> np.save('my_array', a)
>>> np.savez('array.npz', a, b)
>>> np.load('my array.npy')
```

```
>>> np.loadtxt("myfile.txt")
>>> np.genfromtxt("my file.csv", delimiter=',')
>>> np.savetxt("myarray.txt", a, delimiter=" ")
```
